The present sequence is domain B of human hepreceptor of human ezrin. The presceptor is a novel active site in human ezrin. Bzrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AABB2021 to AABB2041) that bind to hepreceptor with greater affinity than HEP1 (see immune response, and for treating peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present sequence assembles into two anti-parallel

cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic acityity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used in the prevention, diagnosis cample, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that ffect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally. N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host colon cancer-associated Ps, by inserting the nucleic acids into a host call and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AMH37196 to AMH37204 and AMB7789 represent sequences used in the exemplification of the present invention. N.B pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027
                                                                                                                         ..

```
The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC3089-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition, kits comprising polynuclectide probes and/or monoclonal antibodies for carrying out the methods of the invention, methods for the identification of compounds that modulate the invention; methods for the identification of compounds that modulate the invention; methods for the polynuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC31861-ADC32627) and the polypeptides encoded by the contigs (ADC32628 contig sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, forenation, gene mapping, in the identification of mutations responsible for genetic disorders or other treating blodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic animal subjected to path and which is differentially regulated in an animal subjected to path and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymocleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymocleotide sequence which is differentially expressed in a mainal subjected to pain, a method for identifying a
                        disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The mucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmet directly from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, pain; neuronal tissue; gene therapy;

         polymucleorides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polypeptides given in the open polypeptides or their antibodies. The polypeptide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip, wipo. int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /notes "the Tyr at this position can be mutated (preferably to a Phe) to construct an ezrin mutant of the invention"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention provides a pharmaceutical composition containing ezrin protein, RNA or DNA mutated on tyrosine 353, or a functional fragment or derivative of the ezrin mutant. The new composition is useful for prevention and/or treatment of tumors, and especially metastasis. The present sequence represents the amino acid sequence of human ezrin (before the maturation by deletion of the first amino acid Met)

Sequence 586 AA;

cuseful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other trained. Training blodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disorders, wounds, burns, ulcers, osteoporcois, ancemia, platelate disorders, wounds, burns, ulcers, osteoporcois, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence of data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print of the print

The invention relates to novel human secreted polypeptides. The polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.
                                                                                                                                                                                                                             Human, vaccination; gene therapy; nutritional supplement; stem cell proliferation; haematopoiesis; nerve tissue regeneration; immune suppression; immune stimulation; anti-inflammatory; leukaemia.

```

The invention relates to 971 novel human cDNA sequences (ADC29919-CD20889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of polynucleotides or polypeptides of the invention; and methods of invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the invention of compounds that modulate the invention; methods for the invention of compounds that modulate the invention; methods for the dentification of compounds that modulate the expression or activity of the polynuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC31861-ADC32627) and the polypeptides encoded by the contigs (ADC33628) -ADC33394). The nucleic acids and polypeptides of the invention are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or
are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon sind/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29910-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention

invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polynuclectide probes and/or monoclonal antibodies for carrying out the methods of the cinvention; methods for the identification of compounds that modulate the expression or activity of the polynuclectide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention of (ADC31361-ADC3262) and the polypeptides encoded by the contigs (ADC31361-ADC3324). The nucleic acids and polypeptides of the invention are cuseful in diagnostics, drug screening, forensics, gene mapping, in the contists, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's cisacase and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoliment assessing corrients. The public periodic primers and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically and shown in electronic format directly from WIPO at the invention, but were contained in a fortuning matt of the printed specification, but the contained and are decombined discases. The sequence of the invention. Note: The sequence of the invention of the printed specification, but the contained and are decombined and are decombined by the contained and are decombined and are decombined by the contained and are decombined and are decombined and are decombined and are decombined by the contained and are decombined and are decombined by the contained and are decombined and and are decombined by the contained and are decombined by the contained and are decombined by the contained and are decombined by

hepreceptor (AAB82019 and AAB82020)

Sequence 14 AA;

SXS

called human colon cancer antigens, given in AAB52234 to AAB5406. The human colon cancer antigens can have cytostatic, cardioactive, muscular, neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, infectious diseases, and cardiovascular disorders, infectious diseases; and cardiovascular disorders and AAB54007 represent sequences used in the exemplification of the present invention AAC97991 to AAC98763 encode the human colon cancer associated proteins, Claim 11; Page 1449-1451; 2104pp; English.

Novel regulatory or unfolding peptides of ezrin that binds to Hepreceptor, useful for inducing immune response for treating infectious diseases and cancer. The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see ABB2021 to AAB82041) that bind to hepreceptor with greater affinity than HEPI (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domains A and B of the Claim 20; Page 36; 42pp; English.

The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to abstrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are nutritional supplements. They may be used to increase stem cell proliferation, to regulate haematopolesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AUC29510-AAU33304 represent the amino acid sequences of novel human

The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82021 to AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domain A of the hepreceptor (AAB82019)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human Breast cancer-associated protein isoform, BPI-1 peptide #3
                             Human, hepreceptor; cytostatic, anti-HIV; antibiotic; nootropic; immune response inducer; ezrin; infectious diseases; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; Breast cancer-associated protein isoform; breast cancer; immunogen; cytostatic; BPI; tryptic digest peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                              Novel regulatory or unfolding peptides of ezrin that binds to Hepreceptor, useful for inducing immune response for treating diseases and cancer.
Human hepreceptor domain A binding peptide Rupe2132.
                                                                                                                                                                 /note= "Optionally phosphorylated"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel regulatory or unfolding peptides of ezrin that binds to Hepreceptor, useful for inducing immune response for treating infectious diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82021 to AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domain A of the hepreceptor (AAB82019)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

```
The invention relates to diagnosing, determining the stage or severity, or identifying the risk of a subject developing cancer (especially breast cancer), or monitoring the effect of therapy on a subject with cancer, comprising analysing a test sample using two-dimensional electrophoresis and detecting Breast Cancer-Associated Protein Isoforms (BPIs). The methods disclosed are used for the diagnosis and prognosis of breast cancer, and concer, it cancer, for determining the severity of breast cancer, and monitoring the effect of therapy administered to a subject Antibodies raised against the binding domain of a BPI, and the composition for treating or preventing breast cancer. The methods use sensitive and specific biomarkers provide early diagnosis of breast cancer, and the fewer side effects that other prior art methods. The present sequence is a tryptic digest peptide from a BPI of the invention
                                                                                                                                                                                                                                                                                                                 Identifying proteins for clinical screening, diagnosis and prognosis
breast cancer, comprises detecting Breast Cancer-Associated Protein
Isoforms (BPIs) using two-dimensional electrophoresis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; hepreceptor; cytostatic; anti-HIV; antibiotic; nootropic; immune response inducer; ezrin; infectious diseases; cancer; HIV-related dementia.

Novel regulatory or unfolding peptides of ezrin that binds to
Hepreceptor, useful for inducing immune response for treating infectious
                                                                                                                                                                                                         The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleton to control cell surface topography. The present invention relates to peptides (see AAB82021 to AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present peptide binds to domain A of the hepreceptor (AAB82019)

Sequence 6, Application US/08725027
Patent No. 6251586
GENERAL INFORMATION:
APPLICANT: MULSHINE, JAMES, L.
APPLICANT: TOCKMAN, MELVYN, S.
TITLE OF INVENTION: DNA THEREOF FOR USE IN EARLY CANCER DETECTION
TITLE OF INVENTION: DNA THEREOF FOR USE IN EARLY CANCER DETECTION
NUMBER OF SEQUENCES: 23
CORRESSEE: MORGAN & FINNEGAN, L.L.P.
STREET: 345 PARK AVENUE
CITY: NEW YORK
STATE: NEW YORK
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Sequence 896, Application US/09925299

Sequence 806, Application US/09925299

Patent No. US20020055627A1

GENERAL INFORMATION:

APPLICANT: Rosen et al.

TITLE OF INVENTION: Nucleic Acids, Proteins and Antibodies

FILE REFERENCE: PALO2

CURRENT APPLICATION NUMBER: US/09/925,299

CURRENT FILING DATE: 2001-08-10

PRIOR FILING DATE: 2001-08-10

PRIOR FILING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 1556

SOFTWARE: PATENTION PALE: 1999-03-12

NUMBER OF SEQ ID NOS: 1556

SEQ ID NO 896

LENGTH: 635
                                                                    APPLICANT: Zhang, Bing
APPLICANT: Glbson, Bradford W.
APPLICANT: Glbson, Bradford W.
APPLICANT: Glenn, Cary W.
APPLICANT: Glenn, Cary M.
APPLICANT: Warnock, Dale E.
TITLE OF INVENTION: TARGETS FOR THERAPEUTIC INTERVENTION
TITLE OF INVENTION: IDENTIFIED IN THE MITOCHONDRIAL PROTECME
FILE REFERENCE: 660088.465
CURRENT APPLICATION NUMBER: US/10/408,765A
CURRENT FILING DATE: 2003-04-04
NUMBER OF SEQ ID NOS: 3077
SOFTWARE: FREESE for Windows Version 4.0

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Probably involved in connections of major cytoskeletal
structures to the plasma membrane.
-!- SUBCELMUAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Component of the microvilli of intestinal
epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

J. Biol. Chem. 276:17373-17379 (2001).

Represses transcription of at least eight genes required for fatty acid transport and beta-oxidation among which fadA, fadB, fadD, fadL and fadB. Activates transcription of at least three genes required for unsaturated fatty acid biosynthesis: fabA, fabB and iclR, the gene encoding the transcriptional regulator of the aceBAK operon encoding the sylvaxlate shunt enzymes. Binding of fadR is specifically inhibited by long chain fatty acyl-CoA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                Tature 413:852-856(2001).

Lature 413:852-856(2001).

Represses transcription of at least eight genes required for fatty acid retabolism.

Represses transcription of at least eight genes required for fatty acid transport and beta-oxidation among which fadb, fadb, fadb, fadb, fadb and fadE. Activates transcription of at least three genes con required for unsaturated fatty acid biosynthesis: fabb, fabB and confour for the great encoding the transcriptional regulator of the aceBAK operon encoding the alyoxylate shunt enzymes. Binding of fadR is specifically inhibited by long chain fatty acyl-CoA compounds (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -:- SUBDNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII' complex. PollII' associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex (By similarity).

Purthmayr H., Lankesw W.R.,
Mosein, a new cytoskeleral protein and constituent of filopodia: its
role in cellular functions.";
Kidney Int. 41:665-670(1992).
-!- FUNCTION: Probably involved in connections of major cytoskeletal
structures to the plasma membrane.
-!- SIMILARITY: Contains 1 FERM domain.
